

Synthetic Experimental Results: A Regression Fixture

Abstract. This document is a license-clean synthetic academic-style fixture generated for Phase 071's DoclingExtractor regression net (D-071-16). It contains five tables of synthetic experimental data and five embedded figures, designed to exercise Docling's layout-analysis pipeline. The content is deterministically generated and contains no real-world or copyrighted data.

Section 1: Experimental Condition 1

We report the results of Experimental Condition 1. Mean values are presented with standard deviation across five trial repetitions. Statistical significance was assessed via a two-tailed t-test against the control baseline ($p < 0.05$).

Metric 1	Mean	SD	n	p-value
Treatment A	1.30	0.060	5	0.001
Treatment B	1.05	0.080	5	0.002
Treatment C	1.55	0.070	5	0.001
Control	1.00	0.040	5	—

Figure 1: Visualisation of Condition 1 results.

Section 2: Experimental Condition 2

We report the results of Experimental Condition 2. Mean values are presented with standard deviation across five trial repetitions. Statistical significance was assessed via a two-tailed t-test against the control baseline ($p < 0.05$).

Metric 2	Mean	SD	n	p-value
Treatment A	1.40	0.070	5	0.002
Treatment B	1.15	0.090	5	0.004
Treatment C	1.65	0.080	5	0.002
Control	1.00	0.040	5	—

Figure 2: Visualisation of Condition 2 results.

Section 3: Experimental Condition 3

We report the results of Experimental Condition 3. Mean values are presented with standard deviation across five trial repetitions. Statistical significance was assessed via a two-tailed t-test against the control baseline ($p < 0.05$).

Metric 3	Mean	SD	n	p-value
Treatment A	1.50	0.080	5	0.003
Treatment B	1.25	0.100	5	0.006
Treatment C	1.75	0.090	5	0.003
Control	1.00	0.040	5	—

Figure 3: Visualisation of Condition 3 results.

Section 4: Experimental Condition 4

We report the results of Experimental Condition 4. Mean values are presented with standard deviation across five trial repetitions. Statistical significance was assessed via a two-tailed t-test against the control baseline ($p < 0.05$).

Metric 4	Mean	SD	n	p-value
Treatment A	1.60	0.090	5	0.004
Treatment B	1.35	0.110	5	0.008
Treatment C	1.85	0.100	5	0.004
Control	1.00	0.040	5	—

Figure 4: Visualisation of Condition 4 results.

Section 5: Experimental Condition 5

We report the results of Experimental Condition 5. Mean values are presented with standard deviation across five trial repetitions. Statistical significance was assessed via a two-tailed t-test against the control baseline ($p < 0.05$).

Metric 5	Mean	SD	n	p-value
Treatment A	1.70	0.100	5	0.005
Treatment B	1.45	0.120	5	0.010
Treatment C	1.95	0.110	5	0.005
Control	1.00	0.040	5	—
